National University of Computer and Emerging Sciences

Laboratory Manuals for Computer Networks - Lab

(CL -3001)

Course Instructor	Dr. Arshad Ali
Lab Instructor(s)	Mr. Usama Khan Mr. Muzammil Muneer
Section	BCS-5C
Semester	Fall 2023

FAST School of Computing FAST-NUCES, Lahore

Lab Manual 02

Objectives:

- To learn basic commands of Linux related to Directory and File Manipulation, Process management and Network Management
- GNU Debugger using a C Language Program

Lab Statements

1. Find out the purpose of the following commands and execute them on your system with different parameters. [1]

ls, cd, pwd, mkdir, rmdir, rm, cp, mv, touch

2. Some commands may be new for most of you. Practice these terms on your own: [9]

4	The ten and a second of the se	,
top	The top program provides a dynamic real-time view of a running	top
	system. It can display system summary information as well as a	
	list of tasks currently being managed by the Linux kernel.	
ps	ps displays status of a selection of the active/currently running	ps
	processes.	
kill pid	Kill is used to send a signal to a process. Where pid stands for	kill –SIGKILL
	process id	pid
	Default syntax for this is kill [-signal number or name)] pid	
	On your terminal to see the list of available signals. Kill -L	
	A PID of -1 is special; it indicates all processes except the kill	
	process itself and in it. It will terminate all programs and log	
	off. BEWARE!	
chmod	This command is used to grant or revert reading, writing, and	
	executing permissions from a user, group or others. Following	
	are the symbolic representation of three different roles:	
	You can check the details by typing	
	man chmod	
	chmod 400 lab1.txt	
	Check what happened to your file.	

chmod 700 lab1.txt What happened to your file? ifconfig ifconfig is used to configure the kernel-resident network interfaces. If no arguments are given, ifconfig displays the status of the currently active interfaces. If a single interface argument is given, it displays the status of the given interface only; if a single -a argument is given, it displays the status of all interfaces, even those that are down. Otherwise, it configures an interface. Foute Route manipulates the kernel's IP routing tables. Its primary use is to set up static routes to specific hosts or networks via an interface. SS The command is used to investigate socket statistics. Use ss-u for udp and ss-t for tcp sockets to analyze which sockets are being used for which protocol. Wget Wget stands for "web get". It is a command-line utility which downloads files over a network. It supports HTTP, HTTPS, and FTP protocols, as well as retrieval through HTTP proxies. wget has been designed for robustness over slow or unstable network connections; if a download fails due to a network problem, it will keep retrying until the whole file has been retrieved. If the server supports rejects permission, it will instruct the server to continue the download from where it left off. The simplest way to use wget is to simply provide it with the location of a file to download over HTTP. For example, to download the file http://website.com/files/file.zip, this command: wget http://website.com/files/file.zip Where will this file be downloaded? traceroute traceroute prints the route that packets take to a network host. traceroute gives an insight to the entire path that a packet travels through, names and identity of routers and devices in your path,		Now write	
ifconfig is used to configure the kernel-resident network interfaces. If no arguments are given, ifconfig displays the status of the currently active interfaces. If a single interface argument is given, it displays the status of the given interface only; if a single -a argument is given, it displays the status of all interfaces, even those that are down. Otherwise, it configures an interface. Foute Route manipulates the kernel's IP routing tables. Its primary use is to set up static routes to specific hosts or networks via an interface. SS The command is used to investigate socket statistics. Use ss-u for udp and ss-t for tep sockets to analyze which sockets are being used for which protocol. Wget wget stands for "web get". It is a command-line utility which downloads files over a network. It supports HTTP, HTTPS, and FTP protocols, as well as retrieval through HTTP proxies. wget has been designed for robustness over slow or unstable network connections; if a download fails due to a network problem, it will keep retrying until the whole file has been retrieved. through, names and identity of routers and devices in your path,		traceroute gives an insight to the entire path that a packet travels	
		through, names and identity of routers and devices in your path,	

	network latency (the time taken to send and receive data to each	
	devices on the path). It's a tool that can be used to verify the path	
	that your data will take to reach its destination, without actually	
	sending your data.	
	Write on your terminal	
	traceroute nu.edu.pk	
nslookup	nslookup is a network administration tool for querying the	
	Domain Name System (DNS) to obtain domain name or IP	
	address mapping or any other specific DNS record. It is also used	
	to troubleshoot DNS related problems.	
	Write on your terminal window	
	nslookup <u>www.google.com</u>	
host	It is an alternative of nslookup but with more details. Write up on	
	your terminal window: host www.google.com	

3. Ping command: [2]

Ping is a command that is used to check the connection and latency rate between two computers in a network. One network pings another in order to exchange data packets (Response) to calculate the latency and exchange rate.

Syntax for Pinging is:

ping [other network's ID (Domain/IP Address)]

Question - You are required to ping at least 5 other networks (including your own address i.e. 127.0.0.1) and compare the <u>latency rate</u> of all networks.

- 4. Write a C program to find out the host byte ordering (little endian/big endian) of your machine. Your program must output the byte ordering of your machine along with the data stored in the individual bytes e.g, you can store a number in hex as 0x3412 and visualize how data is stored in the memory (either in little endian or big endian). You must be able to debug your program using **GNU Debugger i.e.,** to view variable values during running program, to insert breakpoints, to check some condition etc. [3]
 - Hint: C has a datatype short. It takes 2 bytes. Now, you can store some data in your short datatype and read memory byte wise. Well you can use other datatypes too.
- 5. Write a C Program to find out the Average CPU Utilization Percentage in Linux System over the entire time your program is executing. You can read the first line of the file named stat having the path "/proc/stat" to get the string depicting the CPU usage. It will look like this:

cpu %user %nice %system %idle %iowait %irq %softirq

You will then parse the string to extract the relevant information and print it out on the terminal. As this file keeps on getting updated, so you have to keep on reading the file in an infinite loop, process the information and then print the Average CPU utilization percentage on the terminal. You have to read the two samples with a gap of 1 sec and find out the average CPU utilization percentage over these two intervals with this sequence repeating indefinitely.

Hint: The time CPU has remained idle is represented by %idle and %iowait fields.
